

SynGO enrichment of RBP knockdown dAPA genes

15 terms: union of the 10 most significant terms per knockdown (FDR <= 0.05 on >= 3 genes)

Colour is fold enrichment (observed / expected overlap) and is comparable across columns. Size is $-\log_{10}$ FDR and is not:

the input sets differ in size (PTBP2 n = 398, PCBP2 n = 25, CPSF6 n = 335 knockdown dAPA genes, BH <= 1e-4), so FDR tracks power as much as effect.

Black outline = significant; grey outline = not; white centre = fewer than 5 overlapping genes; x = not tested (fewer than 3 matching genes).

SynGO v1.3, default settings, brain-expressed background.
